

Running the FTP Download Demo

PowerPackPro V3.0.4 (and later) is pre-loaded with sample files for all the SPC loggers, plus a demo FTP site to showcase the DTM file transfer capability. We've uploaded some SPC surveys to the web using a DTM, and provided your PC has a web connection, these can be downloaded and imported into your software with a few clicks of the mouse. Here's how...

Open the program and right click the FTP 'Demo' location at the top left of the desktop tree. Select 'Synchronise' to initiate the file import process, and then follow the instructions on the screen for each file. The software will prompt you to tell you that new surveys are available, and then guide you through the import process. If you are familiar with SPC Loggers already, you'll recognise the import process as identical to that used for direct download via USB. Once the files have been imported, they are available for further analysis at any time by opening them from the tree.

If you wish to repeat the import, simply right-click the 'Demo' location again and select 'Download Files...' Click on a file to view its details and select it for download.

Further details of all the features of PowerPackPro and are available from the SPC User Manuals. All are available for download at www.spclloggers.com
